## The simpler way to protect your business

As cybercrime increases and changes constantly, so does the technology we need to protect our companies. Every day a new security solution arrives to stop each threat, making it difficult to afford- not only for the solution itself, but for the manpower needed to manage, maintain every day.

Organizations need a modern new alternative to ensure the protection of their systems in a simple but efficient way that does not require multiple solutions to cover the critical issues nor an army to manage them.

### Key Benefits

#### Simple

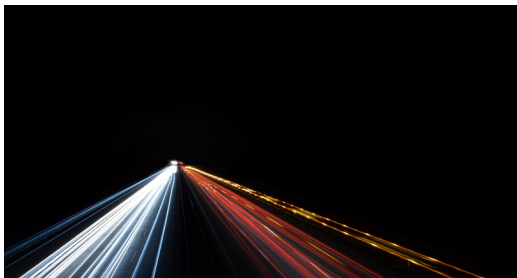

Easy Security provides a cloud based software (SAAS) to secure your company. A unified solution to solve all the basics and not-so-basics you must cover to ensure your cybersecurity posture. We minimize cybersecurity complexity to allow you to focus on your business.

#### Secure

Every feature we develop is created with your security in mind and what you need to have a more secure presence on the internet. We have strict security protocols in place to protect your information.

#### Efficient

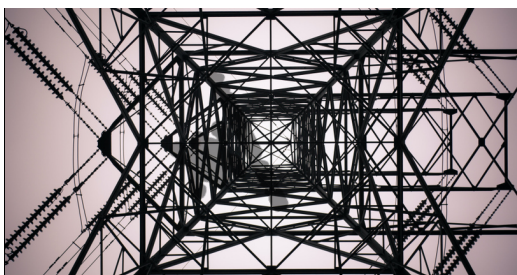

At Easy Security, we take care of everything you need to protect your company. You do not have to spend a fortune on infrastructure or manpower or even create a Research and Development (R&D) program in order to be up-to-date in cybersecurity matters. We keep your cybersecurity posture updated in real time

- Faster response to threats.
- Real time alerts.
- Latest security trends.

- Status reports.
- Anticipate attacks.
- Easy to use interface.

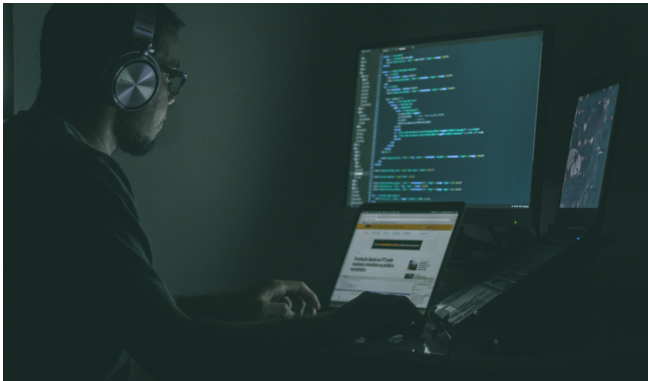

- Complete visibility.
- Security compliance.
- Fast deploy and configuration.

# Features

## Cloud Security

Receive an alert when a misconfiguration, vulnerability or excessive privilege is found. We will also suggest recommendations to comply with the best practices to secure your cloud environment.

## Security Controls

A web server that stops responding properly, an SSL certificate that is about to expire or has an insecure configuration, a password leak, an email domain that was blacklisted due to misuse, or a crypto jacking detected in your websites- among others.

## One Time Passwords

Just enable this module to upload your OTP seeds or generate new ones.

## Vault

Protect generic credentials of your systems - to include your admin or root cloud accounts, API keys, service accounts, or any critical data that you need to store and use securely.

## User Awareness

Users are targeted to gain unauthorized access to your information and systems.

We built this module to identify these users, as well as providing custom training to generate awareness of the attack vectors to which they are exposed.

## Self Awareness

We created this self-assessment module to help you identify how mature your company is on cybersecurity aspects and how well your processes work. After which we'll provide recommendations to improve your cybersecurity.
